Dock Dock (officially Asynchronous Dock, or app-docking metaphor) is a standard metaphor used for managing multiple windows of the same application. It takes place of the taskbar, and allows one window to "float" in the background, while the other is brought to the front. The metaphor is also often used in describing a desktop metaphor for user interfaces, for example in the Apple Human Interface Guidelines. An example of a dock is the Apple Dock, which has windows for the currently running applications, file system windows, and window buttons. The term "dock" first appeared in Apple's Advanced Technology Group (ATG) project PIP (Personal Information Processor) for a graphical multi-window interface used in the PowerBook series. PIP was planned to be used in the 1994 introduction of the Power Macintosh in the 1990s. The PIP project did not see the light of day but is known for the dock feature. The Dock project was introduced in 1998 to build upon the PIP technology. The Mac OS X operating system includes a Dock widget that allows window and folder icons 2d92ce491b
