I bought my HP compaq 8200 elite SFF computer in march of 2015. At the time of purchase I just had used it on the shelf for a few months. The original drivers that came with the laptop were the sp0v0.98.15 and that was what was used on Win7 Pro 64bit. Installation I tried to install the HP sp0v0.98.15 drivers that came with the laptop on my Win7 Pro 64 bit and encountered the same issue described on the How to run HP . Update on 2-27-16: This is the upgrade version sp1 of the sp0v0.98.15 sp0v0.98.15 This is the installation for the newer sp1 version HP sp1v0.98.15 installation for the 8200 series PC's. The newest drivers are sp0v0.98.15, and sp1v0.98.15 The installation is the same as with sp0v0.98.15 except: The installation does not include the desktop manager and needs to be installed separately. See this image: I used the.exe and only accept the licence agreement for the Windows 10 pro x64 drivers. I only chose the sp0v0.98.15 install as this is the most current install in the link above. My problems: I have the same problem in this case: The device manager shows no driver and only lists the following: I have tried to install the latest drivers (sp1v0.98.15 and sp0v0.98.15) and get the same error: I have also tried the previous drivers that were supplied by HP: When I do a Search in the Device Manager for the following: HP HP-SmartArray P400 ATA Controller Hitachi Thermal Diode Driver The following show up: I have tried the steps described on the How to run HP . I have tried all of the drivers listed on the HP website, as well as updating the device manager, but the issue persists. I also tried the method described on this How to run HP . A: My problem was resolved after I did the following:
Downloaded the HP sp0v0.98.15 Driver on Windows 7 64bit Accepted the licence agreement
Uninstalled the 2d92ce491b
