Copyright 2009-2020 3dsx.org, updated on 2020-08-22The proposed project involves an interdisciplinary approach to study the long term consequences of factors that influence the post-chemotherapy mortality in patients with ovarian cancer. The overall aim of the proposed project is to develop new methods to classify and measure these factors in a way that will lead to improved survival prediction. The project has two aims: 1) Development of a statistical methodology based on latent traits. For each cancer patient who receives chemotherapy, a series of indicators related to the patient's medical history, prognostic factors, and quality of life is collected. Data collection occurs at the time of diagnosis and then at regular intervals throughout the patient's treatment. This data set is called the Chemotherapy Treatment Pathway (CTP) database. 2) Examination of the ability of the proposed methodology to predict survival in patients with ovarian cancer. The association between a set of variables which have been selected to reflect patient health and mortality in the long term will be estimated using the existing CTP database. A new measurement of patient health will be developed that will be applied prospectively to patients entering the CTP database. This data set will be analyzed to determine its ability to predict mortality, and if a new measurement that is significantly better than the existing measurement is identified, a treatment protocol and evaluation plan will be developed. 4 Tips to Improve the User Experience of Your Site I'm a big believer in the power of user experience. It's my "A" theme: make it easy for people to find what they want, give them a task they're likely to do but not the easiest, and give them a positive experience. It's all about meeting their
