Category:1999 video games Category:Browser games Category:Maritime video games Category:Video games developed in IsraelRole of the A/P-fixed axial nucleoskeletal complex in the origin of the fetal atrioventricular valves. The atrioventricular valve anlage arises from the endocardium in the 4th week of human embryogenesis. However, a morphologically and structurally diverse array of cardiac defects are identified in the congenital heart disease (CHD) spectrum. Here we report a complex and overlapping molecular signaling network underlying the initial formation of the embryonic atrioventricular valves in the human heart, focusing on the role of the apical/posterior-fixed axial nucleoskeletal complex (ANL complex) and the mechanosensitive Tbx6, in the endocardial initiation of this process. We examined the expression patterns of the embryonic cardiac transcription factors, Tbx2, Tbx3, Gata4, Gata5, Hcn4 and Mef2c in the developing right and left atrioventricular valves and ventricles from Carnegie Stage 19 (CS19) to Stage 40 (CS40) embryos. In addition, we analyzed the effects of Gata5 and Tbx3 on ANL complex transcriptional activity, using Gata5- and Tbx3-specific siRNAs in primary cultured endocardial cells. Tbx2 expression was restricted to the atrial chamber of CS19 embryos, while Tbx3 and Hcn4 were expressed throughout the entire atrioventricular heart during CS19 to CS40. Notably, we found that Hcn4 was expressed in the outflow tract (OFT) and atrioventricular anlage (AVA) and the expression patterns of Gata4, Gata5 and Mef2c were restricted to the AVC. Moreover, knockdown of Tbx3 reduced the transcriptional activity of the ANL complex and resulted in lack of cardiac valve development in the right ventricle and outflow tract (RVOT) and the AVC. Furthermore, overexpression of Gata5 in the endocardium led to ectopic formation of tricuspid and mitral valves. These results provide the first evidence that the 2d92ce491b
