Because insulin secreted from the islet cells plays an important role in the maintenance of homeostasis in the human body, loss of insulin-secreting cells by various factors is known to cause type 1 diabetes, and it is expected that insulin secretion will be restored to normal levels by transplantation of the islet cells into the pancreas of patients. In addition, type 2 diabetes is caused by insulin resistance of peripheral tissue, and it has been reported that insulin resistance is restored by transplantation of the islet cells, resulting in recovery of the blood glucose level to normal levels. For these reasons, the cell transplantation therapy has been drawing increasing attention. However, cell transplantation therapy is difficult to perform for the following reasons. For example, in the case of transplantation of the islet cells from human pancreas to a patient, it is generally practiced to remove the exocrine glands from the pancreas. However, the exocrine glands are composed of cells other than the islet cells, and hence the islet cells become contaminated during the removal of the exocrine glands, which makes it difficult to obtain a pure islet cell preparation containing a sufficient number of islet cells. In addition, it has been reported that islet cells are susceptible to immunological rejection. It has been reported that, in the case of transplantation of the islet cells into the liver of a patient, grafts were rejected within 5 years after transplantation. Internet users have complained about the bad quality of the video obtained by the state broadcaster Russia Today from the explosion site at the St. Petersburg metro. The video was broadcast on Thursday evening. The narrator described the burning gas as the site as "undefined" and people were recorded in the building's lobby, screaming and running away as the footage showed a fiery inferno. On Friday, Russia Today correspondent Nikolai Sokolov apologized, writing: "We apologize to everyone for the low-quality footage of the explosion site of the St. Petersburg metro that we published yesterday." "We will improve the quality of future footage. And all of us
