PreNIS Full Crack - Pre Processor to NSIS The PreNIS extension is a scripting language extension that gives the user the ability to perform a wide variety of tasks when building an installer package. PreNIS allows you to manipulate the output of the installer script and use the installer output to do any of the following: * Include DLLs, EXE files or folders as required * Modify the installer file - adding custom headers, properties, footers, actions and sections * Combine multiple files into one installer * Include registry values and macros * Generate a script file for the UI creation or configuration * Obfuscate, encode, remove, encode, compress and so on * Write to a log * etc etc PreNIS is a simple scripting language that looks very similar to VBScript but is much simpler. The most common tags are found below: # This is the main start # You can use for doing include's of files # or for executing exes # The name of the file will be placed in line 1 (line 1.0) # If you use it will produce a NSIS Script # the name of the script will be place in line 1.1 (line 1.1.0) # If you use it will include all files in the folder # eg: if your folder has the following structure: # project_folder/ # | # 1.jpg # 2.txt # 2.xml # subfolder/ # | # 1.html # 2.txt # sub_folder/ # | # 1.html #

=============== PreNIS is a preprocessor macro language extension to the NSIS scripting language to automatically include dlls, exes or project version information in to NSIS scripts. PreNIS Usage: =============== You define the PreNIS macro in your project file. The macro represents a tag that is recognized by PreNIS. After that you simply preprocess the macros in your project using the PreNIS macro directives. PreNIS Directory Structure: =========================== The PreNIS macro's require an entry in the project file to tell PreNIS where to find the project files. If the project files are located in a sub folder, you need to add an entry for that folder too. - The directory path for the project files. - An entry for any folders within the project files. - Close the section. - Any folder you wish to include. - Any file you wish to include. To exclude a file you need to use the PRENIS_EXCLUDE directive instead of PRENIS_REQUIRE. You also need to define a PreNIS macro for each of the files or folders in the folder. Each PreNIS macro directive must be surrounded by two and the PreNIS macro must be enclosed within two Each PreNIS macro takes the name of the file or folder as a parameter. This is useful for including version information and other general information that doesn't need to be in a separate file. You can also have multiple macros within a section to include folders. Syntax for PreNIS Macro Directives: ================================ - A macro that represents the file or folder. - The file or folder to include. - Version info for the file. - Any content you want to include. Example: Title.txt Project Info.txt Config.txt

A: I have created a small util that will convert a DLL from PreNIS into an EXE. I have currently got it working with a single dll and it is only meant for a single file. I am not sure how it could be expanded to a folder of files. This may help some others. CopyThis.exe.config C:\Windows\system32\CdImage.dll C:\Windows\system32\CdImage.exe CopyThis.cpp #pragma once #include //EnvVars #ifdef _DEBUG #define STRING_BASE (GetEnv("CompanyName")) #
