Ok, I guess this is a pretty simple app. On startup, you're given 2 options: reboot and shutdown. The reboot is a kind of restart, so you can't see what the shutdown is going to do. To be sure, you might want to click on the save button, so you can see if you're really booting or shutting down your computer. There's also a restart option, which does a restart. Again, this doesn't tell you what it's actually doing. Shutdown to a single process: As I mentioned earlier, you can give a process a special name, which is useful for any purpose. Note: A shutdown panel might or might not work with your computer, depending on your computer and your version of Windows. Shutdown to a batch of processes: You can also pass arguments to the processes, which is useful in various situations, but not as useful in this case. Shutdown to a single folder: My comments:

Shutdown Panel is a window application that allows you to power off, restart, or log off. You can even lock the station by putting a password on the desktop, if you're the jealous type, but don't let the ability to lock the computer to worry you. The application is absolutely free, making it even more useless than it already is, as well as lacks a scheduler to allow you to delay the operation for a bit or to trigger a function when a specific process closes.
