Six sigma: acquire knowledge is a training program that helps you pass the CSSBB test. The following CSSBB topics are covered in the Six sigma: acquire knowledge test preparation. Why use this program? The goal of developing Six sigma: acquire knowledge is simple. You want to pass the CSSBB test to develop a career as a Six Sigma expert. Enter your URL What is a neural network? Neural networks is a learning algorithm that mimics the human brain. The brain can learn with a high rate of accuracy even when it doesn't have exact knowledge of the problem. In addition, the brain creates associations among the data and learns from the experience gained from previously solved problems. During the learning process, the brain makes a connection between a nerve cell and a larger network of nerve cells to develop a neural pathway. This connection is called synapse. The neuron is the simplest nerve cell in the brain. Neural Network: Classifying Data To classify data, we can use the following two neural networks. Feedforward Neural Network During the learning phase, the network is fed the data and it examines it by using all the connections. After examining the data, the network uses the output to decide how to classify it. Feedforward neural network has the following layers. Input layer Hidden layer Output layer A network with three layers as follows is shown here. Neural Network: Backpropagation There is an algorithm that is used to update the weights and biases based on the values obtained. As the weights and biases are updated, the performance of the neural network increases. The learning process can be explained by the following algorithms. Input layer A set of weights and biases A number of nodes in the hidden layer Output layer The output is calculated by using the input layer, hidden layer and the output layer A network with three layers as follows is shown here. Neural Network: Topology There are three types of topologies: Sigmoid Tanh Relu Feedforward neural networks have two inputs and one output. Weights and biases are added to this input and bias according to a different formula. Weights and biases are learned by using the learning algorithm. After that, this adjusted input is added to a number of sigmoid, tanh, or relu functions as follows. How does it work? A neural network with three layers has a training algorithm
