### What's New In?

Whether or not these particular fly loaches (*Clupisoma* sp.) are as deadly as the Tokyo Squid (*Sepiotes orientalis*) whose beheaded carcass has been found washed ashore on the south coast, the fact that the discovery has occurred is worrying as it shows that a tsunami is far from a myth and that a genuinely disastrous event could occur at any time. Sea level rise due to climate change will not spare this area, although the populations who live there will be able to move upwards at least in time. This doesn't necessarily mean that the local populations will die out, but as shown by the present-day populations on the Ryukyu Islands, once they become accustomed to the sea level rise in the area, their environment will change so much that they will need to adapt to the new situation. The former population numbers show that the Ryukyuan people have developed a high tolerance for salt water. It is hoped that this scientific research will provide a scientific basis for the people of this region to care for their environment so that it will not be irrevocably ruined by global warming. Japan's Meteorological Agency ([www.jma.go.jp/en/index.html](http://www.jma.go.jp/en/index.html)) is currently investigating the actual damage from a tsunami caused by a large earthquake and we can expect to see more of these findings in the coming weeks.
