This article will provide some tips and pointers on how to use Photoshop, including some of the most common actions you'll come across. Creating & Editing Layers The earliest use of Photoshop was to create layered raster image files that you could edit. Layers are the fundamental unit that make up an image. You have layers on top of other layers. To create a new layer you can create a folder and do the following: Go to File > New. Use the Create a new Photoshop Layers folder dialog box that appears to set it to create a folder. Use the Select objects to create a new layer dialog box to drag a layer onto a page. This will create a new layer. The new layer appears on the active page with a yellow padlock icon. This layer is called the active layer, the layer that you're editing. By default, the active layer is the layer just created. Every layer that appears on the active page or layer is an instance of that specific layer. To create a new layer below the active layer, select the New icon at the top right of the layers palette to bring up the Create a new Photoshop layer dialog box. Layer Properties An image, or layer in Photoshop, has a variety of properties that define it. These properties include color, brightness, contrast, density, hue, saturation, and others. Some of these properties change the appearance of the image. For example, adjusting brightness changes the overall tone of the image. Each layer contains a color space which helps define the properties of the image. The color space is called a layer's color space. A color space defines how colors relate to each other in the image, such as if the image is light or dark, or if it has a warm or cool feel. Activate the layer by clicking on the layer or selecting it from the layers palette (menu bar icon). In the Layers palette (menu bar icon), you can see the active layer. You can see its color space by selecting the color space at the top right of the palette and activating that space by selecting the checkbox, or double-clicking it. If you don't see the color space, then the layer is not active. To make the layer active, you must activate it.

Q: Passing tuple as argument to function with type constraints Code sample func lookup(collection: T, where clause: (T.Elements, Int) -> Bool) -> Bool { var index = 0 var value: T.Element? collection.enumerate().forEach { (x, i) in if where clause(&value, i) { index = i } // other stuff } return index == 0 } I am calling the function as lookup(&value, i) I get an error ArgotArgumentError: Trying to pass 1 arguments to function that expects 2 arguments The problem is I do have int? value Why am I getting that error and how to resolve it? A: "ArgotArgumentError: Trying to pass 1 arguments to function that expects 2 arguments" If you pass a variable and a function as a pair, you must supply a second argument. func foo(a, b: Int) { println("%d and %d are equal".format(a, b)) } foo(1, 2) foo(1) // error here Functions don't get any extra information, so it's up to the function caller to pass the extra information. "Value"? I don't know what that is. If you need a pair of optional ints that match some function argument, write it like this: func foo(a: Int, b: Int? = nil) { if b == nil { println("a is nil") } println("%d and %d are equal".format(a, b)) } foo(1) // prints "a is nil" foo(1) // prints "a and 2 are equal" foo(1, 2) // prints "a and 2 are equal" foo(1, 2, 3, 4, 5) // prints "a and 4 are equal" If you don't need all those extra parameters, you can write foo like this: func foo(x: Int, y: Int?) { println("

Q: Indirect addressing in C I am having a hard time understanding why: float *p = (float*) (p+1); is equal to (float*) (((uintptr_t)p) + 1) What I understand is that p is cast to a pointer to a float, but I don't see how casting the argument in the first place leads to the result in the second line. In the first line, is p casted to a void pointer? A: The expression (float *)p is equivalent to: ((float *)p) The type of *p is not void*, as pointed out in the comments, but it is a pointer to the type float. What I understand is that p is casted to a pointer to a float, but I don't see how casting the argument in the first place leads to the result in the second line. First, consider the expression: p + 1; It is a pointer to the type float, so casted to a pointer to the type void *, thus: (void *)((uintptr_t)p + 1); Now, the expression p + 1 is equivalent to: ((uintptr_t)p) + 1; Which casts p to a pointer to the type uintptr_t (aka unsigned int), and then adds one to it. Thus, it is equivalent to the expression: (uintptr_t)p + 1; Vans's unexpected new shoe line makes a statement It seems like every time Vans releases a new shoe, we're already thinking of something else that we want in it. New limited-edition classics are usually the best way to stay on top of our wish lists. To start this year, we want some skate shoes that can kick back and sip a glass of that fine red wine. Some with lace-ups. And there should be an open-toe knit version. Enter "Resonate." A new line of Vans that came out this weekend — quickly sold out. So the interesting part is that the launch on Jan. 12 was quiet, and all the promo pics we've seen so far had been of Vans's new Spring 2014 shoe collection, which drops in March. But the "Resonate
