Heterogeneous networks (Hetnets) Heterogeneous Networks (Hetnets) Traditionally, and in contrast to other (bulk) deployments of femtocells, Hetnets operate under the principle of "multi-radio mix". That is: users can still freely access the macro network via the macrocell and use the macrocell for accessing the Internet (at their normal UMTS, GPRS or EDGE rate). However, when in range of a femtocell, the user is allowed to use the femtocell for wireless broadband but at a reduced rate (i.e. via a downlink of a few Mbps), and restricted to a limited number of channels. While the transition to 4G is being prepared in 3GPP, the introduction of dual-mode femtocells will allow operators to reduce the deployment cost per subscriber and hence accelerate the switch to 4G. This topic is now part of the NFV initiative, with the emphasis to switch from existing 3GPP SGSN/MME to Packet Data Serving Nodes (PDSN). To be able to rapidly switch to 4G within 3G networks, there are two main approaches. Dual-mode Femtocells with NBAS To achieve fast handover, the dual-mode femtocells adopt the Network Base Assisted (NBAS) concept. NBAS indicates fast transfer of the call context from the macro network to the femtocell (i.e. the PDSN of the femtocell) in order to be able to activate the other (femtocell) mode. This also accelerates the handover into the new 4G network. This is the case for both voice and data traffic. The challenge is that for the first times, voice traffics in fact need to be transferred to a GSM network (i.e. back to a 3G node, the MSC). As the MME of the macro is used for the session management (i.e. per call settings and QoS), this requires a new interface to be defined between the SGSN and the MSC of the GSM network. These interfaces enable the split between MME and SGSN functions. Note that the call session is managed by the MME, while the transfer of the call context needs to happen within the SGSN. A detailed description of the architecture for the above figure can
